DETAILED ACTION

1. Claims 3 and 5-14 are allowed.
2. The closest prior art is Kondo et al (US 6,626,322), which discloses predicatively encoding digital video sequences, comprising dynamically determining the resolution of a current frame being encoded and outputting the determination, the selection being based on statistical and coding information of a plurality of frames. However, Kondo et al does not teach determining if a low-to-high resolution switch being affected is given by the following condition, the switch being affected if the condition C2 evaluates to TRUE

$$C_2 = \{Q * M^2 > T_{QM}\} \text{ AND } \{B_{dec} > T_{B2}\} \text{ AND } \{F_{curr} - F_{sc} > T_{sc}\}$$

Where Q is a measure of the quantization scales used to encode a plurality of previous frames, M is a measure of the motion present in a plurality of previous frames and the current frame, B_{dec} is a measure of the decoder buffer fullness, where F_{curr} and F_{sc} are the frame numbers of the current frame and the last scene-change frame respectively and T_{QM} , T_{B2} and T_{sc} are preset thresholds.
